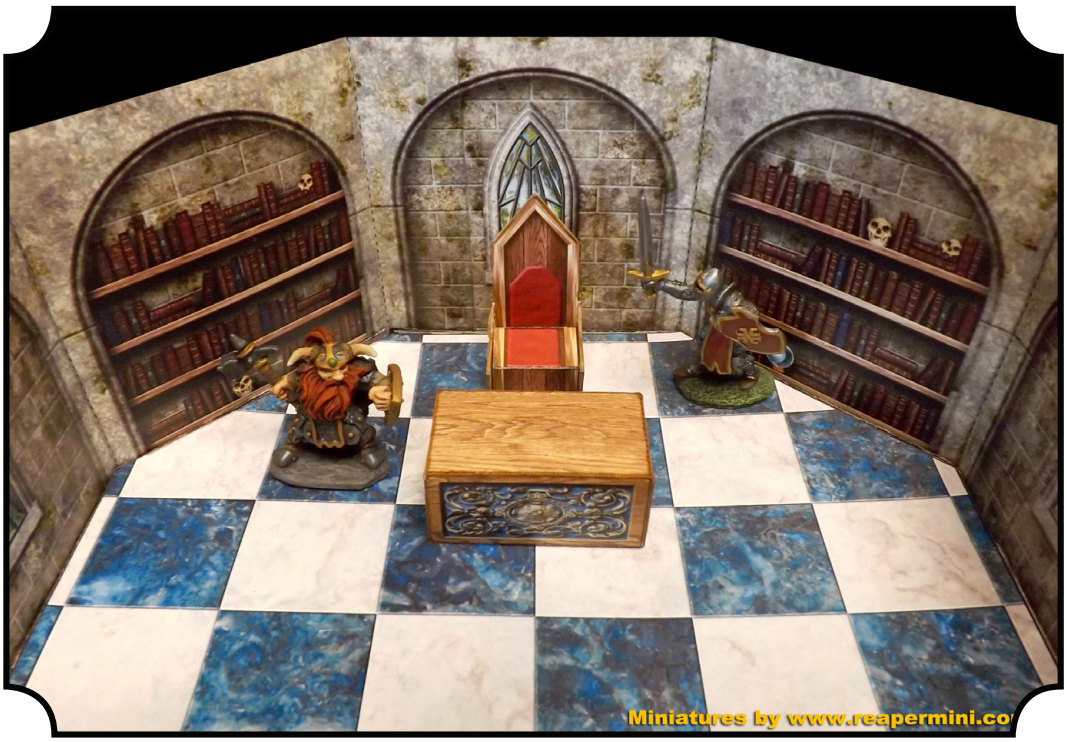
WIZARD'S TOWER

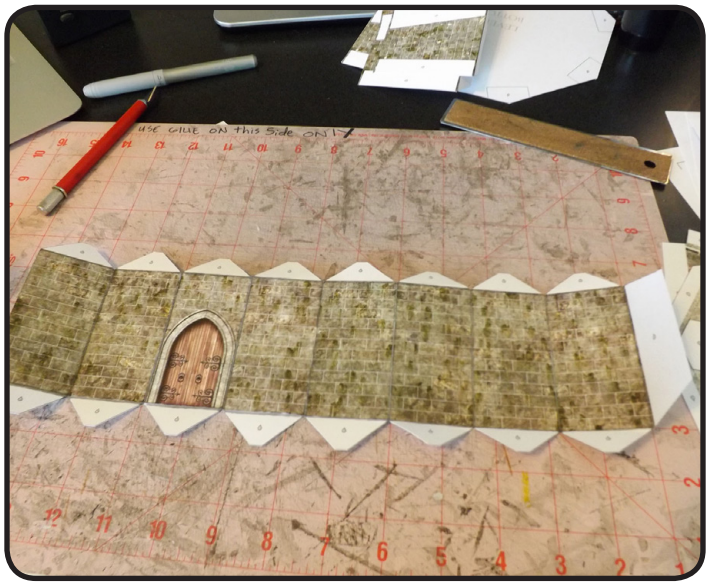


Before proceeding with this document, make sure you have read the beginners guide to card modeling included with this model set. Also, review all of your layer options before printing, there are several ways you can design your tower!

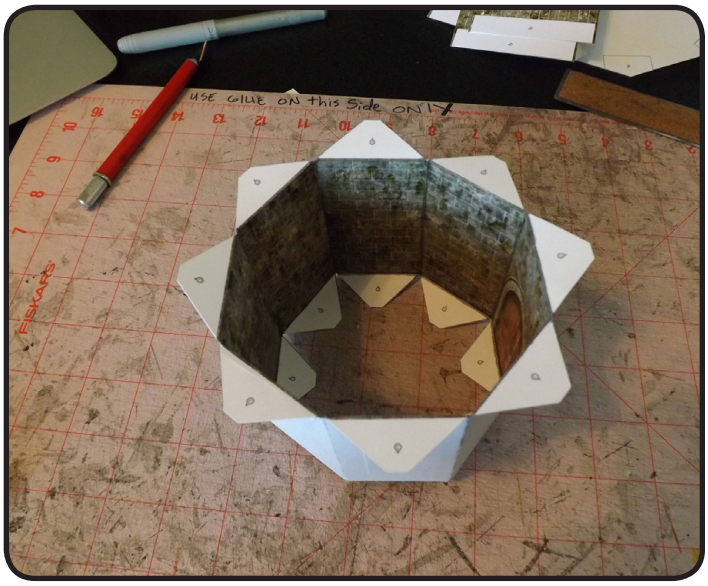
Permission granted to print this document and all related model files for personal use.

FAT DRAGON GAMES

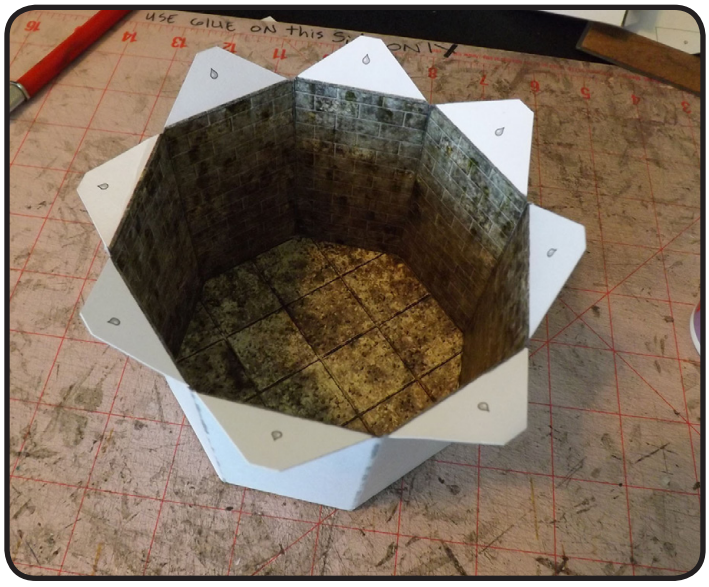
LEVEL 1



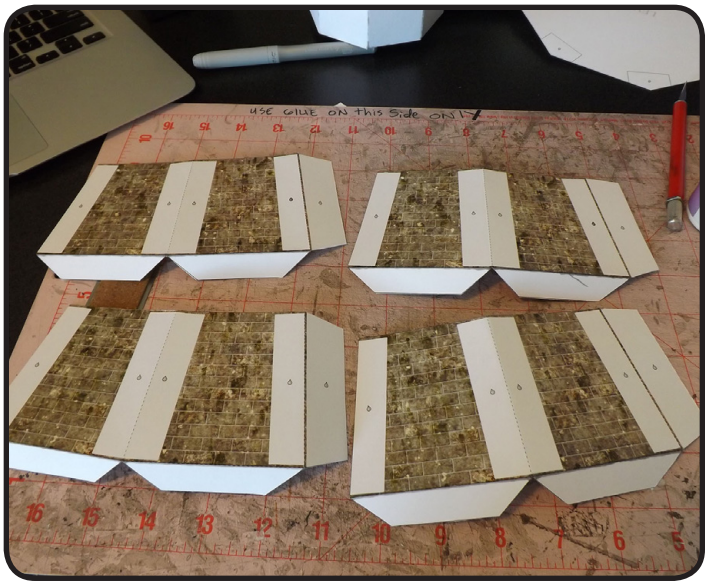
1: Cut and score the two wall sections for the first level interior and glue into one long strip as shown.



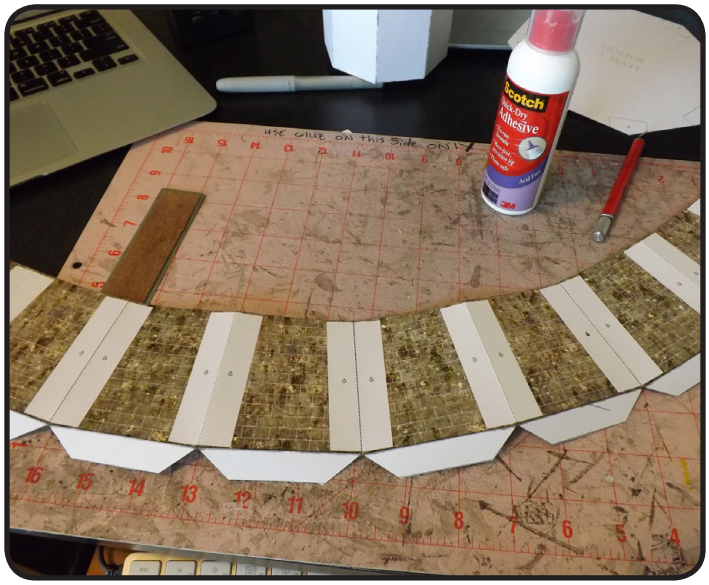
2: Glue into a ring and allow to dry.



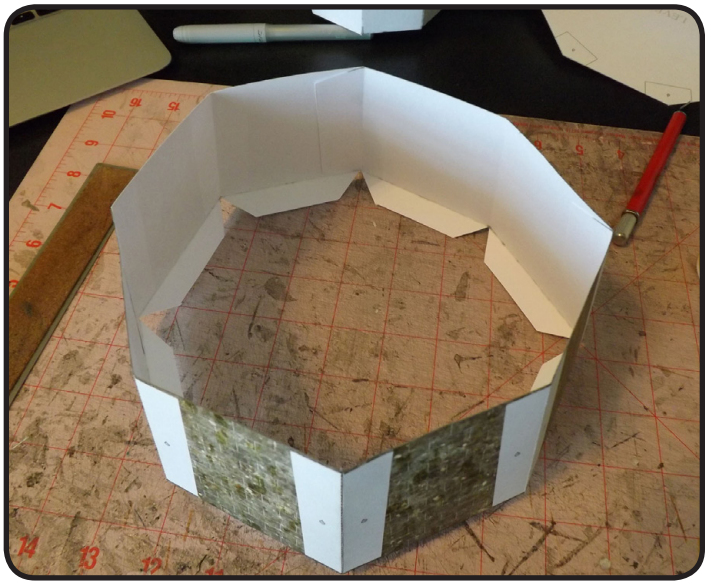
3: Glue the floor piece to the bottom as shown.



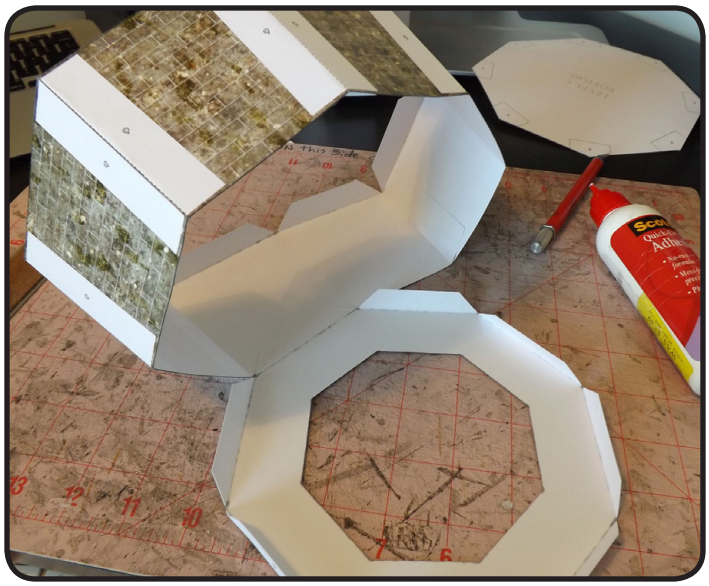
4: Cut, score and test fold the four outer wall sections.



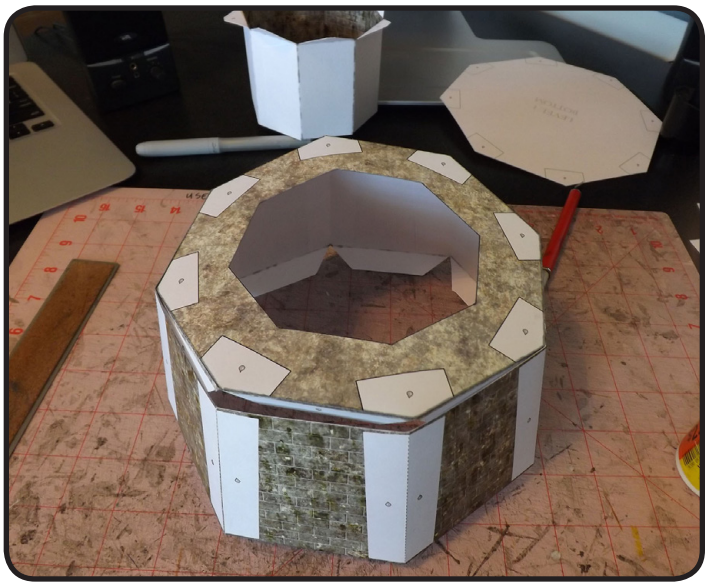
5: As with the interior walls, glue these two pieces into a single long strip and allow to dry.



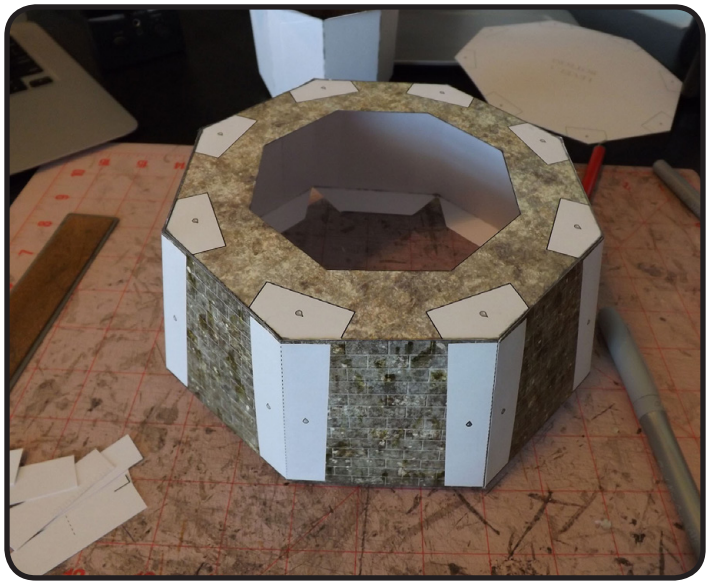
6: Glue into a ring.



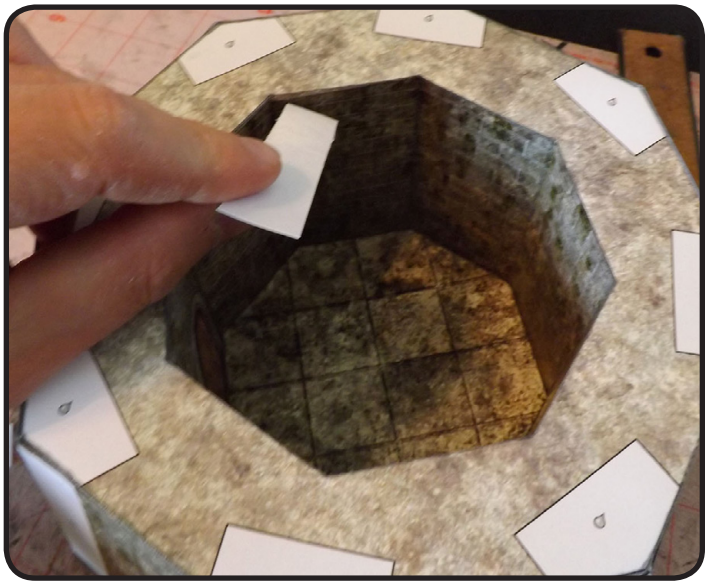
7: Glue only ONE tab of the top section as shown and allow to fully dry before proceeding.



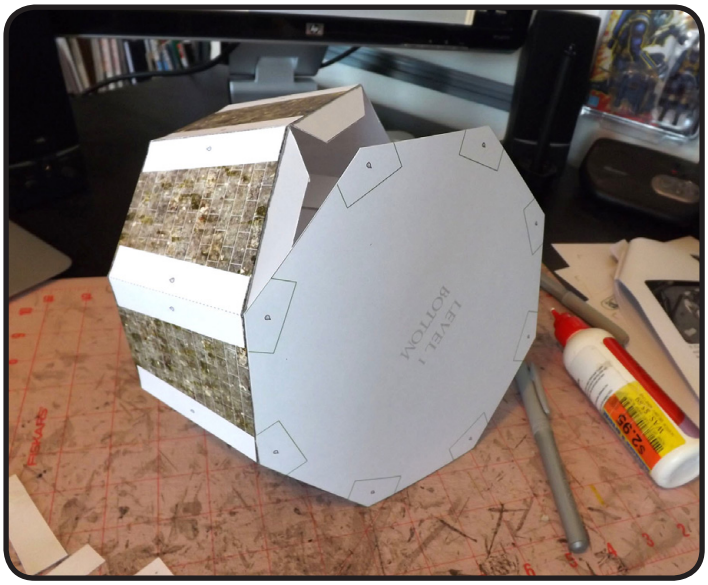
8: Glue the tab directly opposite the one you previously glued. This will help ensure proper alignment once all tabs have been glued.



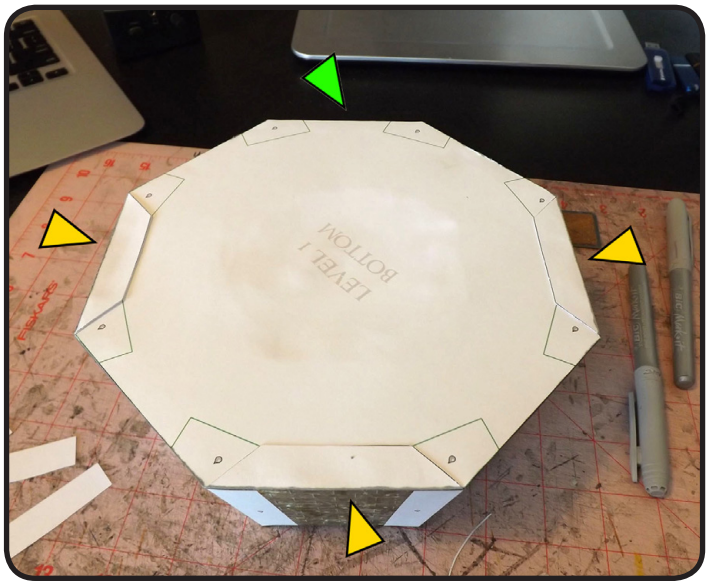
9. Continue gluing tabs around the perimeter.



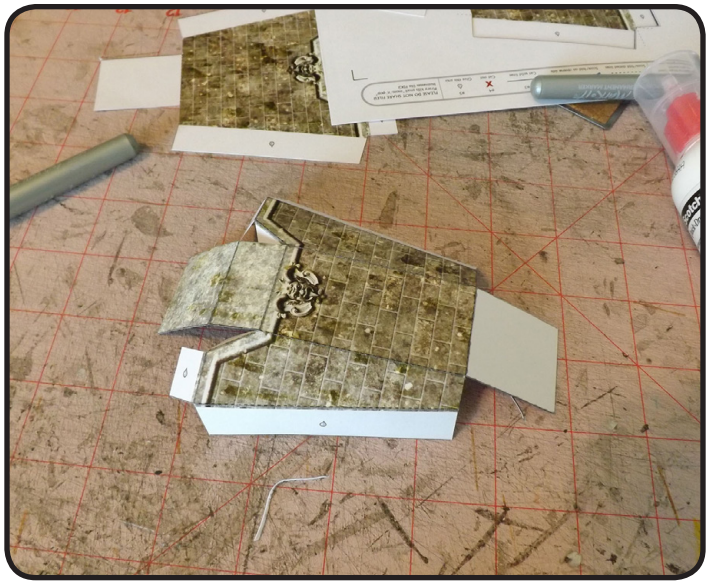
10: Insert the interior section and glue into place as depicted above. You can easily apply glue with a scrap of cardstock slid between the parts.



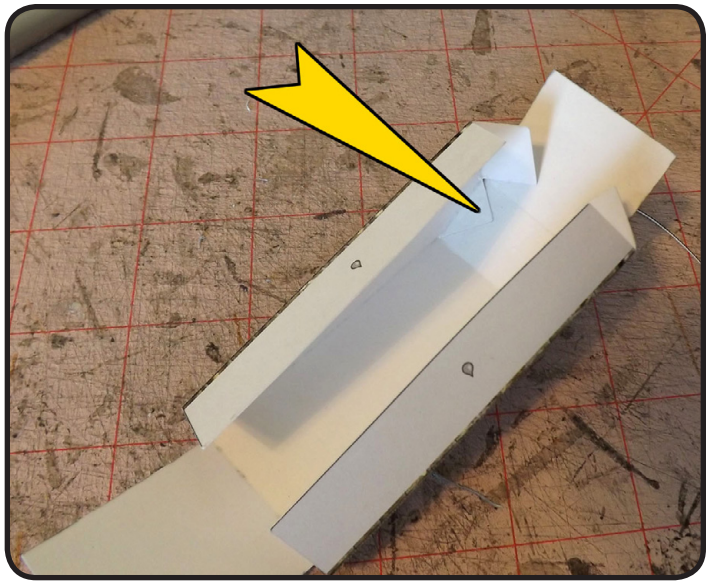
11: Glue the bottom flap just as you did the top flap, one tab at a time.



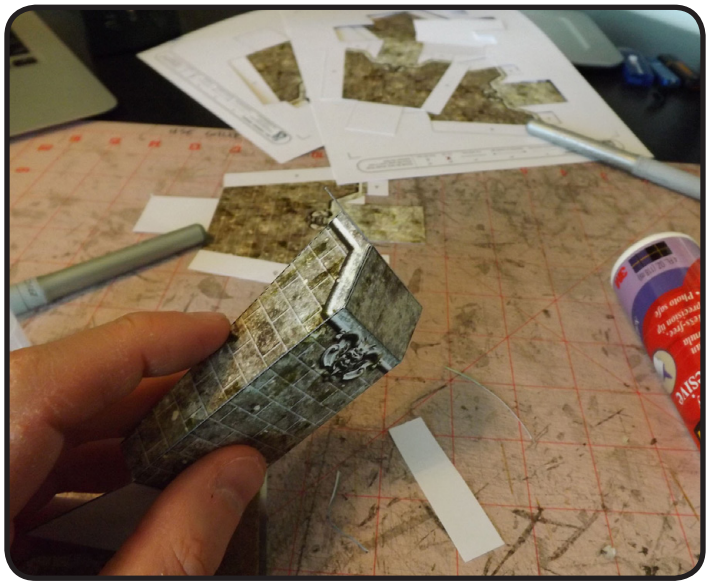
12: When you glue the remaining tabs, it helps if you glue the one directly opposite of the one you first glued (green arrow), and the ones on either side (all three marked with yellow arrows) on TOP of the bottom piece, while all other tabs glue beneath it. This will help keep the piece centered.



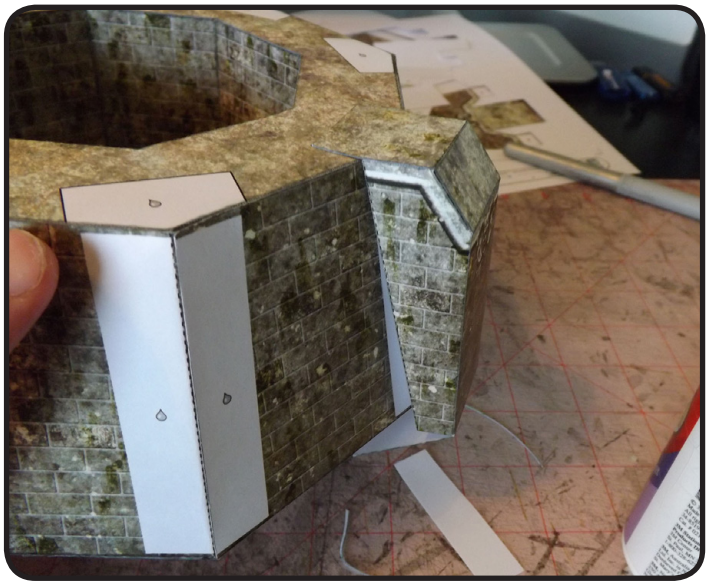
13: The buttresses (*get your mind out of the gutter!*) are very easy to assemble. Cut and score as shown.



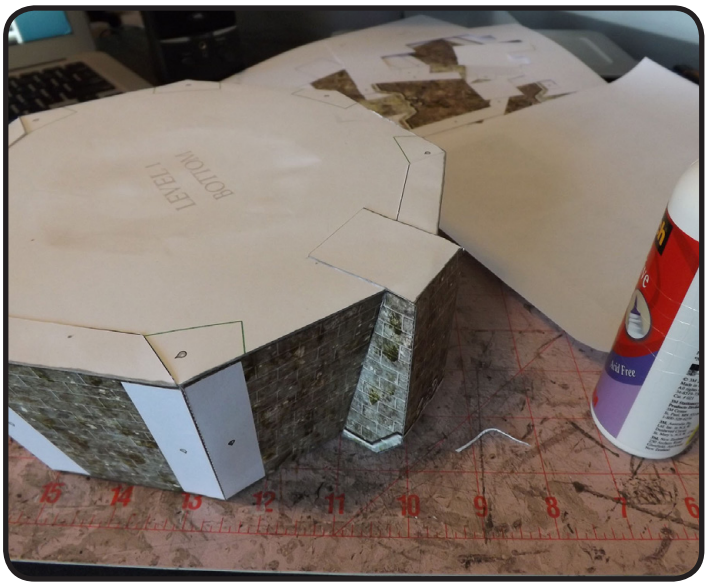
14. Glue the two small triangular tabs first and allow to dry.



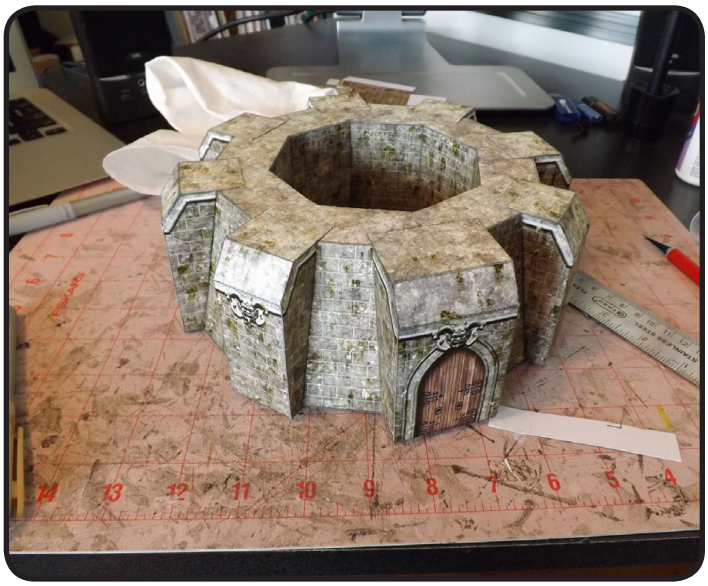
15: Glue the upper, larger square tabs next.



16: Glue to the main structure by first gluing the TOP TAB of the buttress.



17: Now apply glue to the side tabs and the bottom tab and glue into place.



18: The finished lower level should look like this.

LEVEL 2

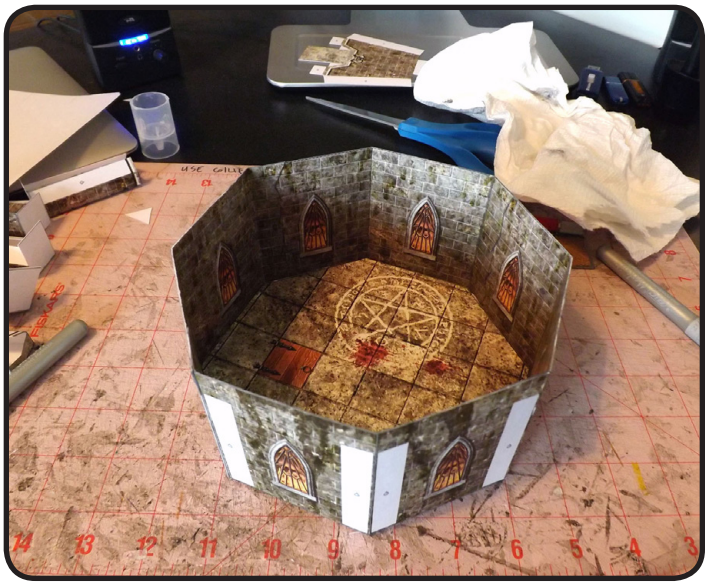
1: The walls for levels 2, 3 & 4 all assemble essentially the same way. Cut, score and test fold as shown.

2: Fold over and glue each section as depicted above.

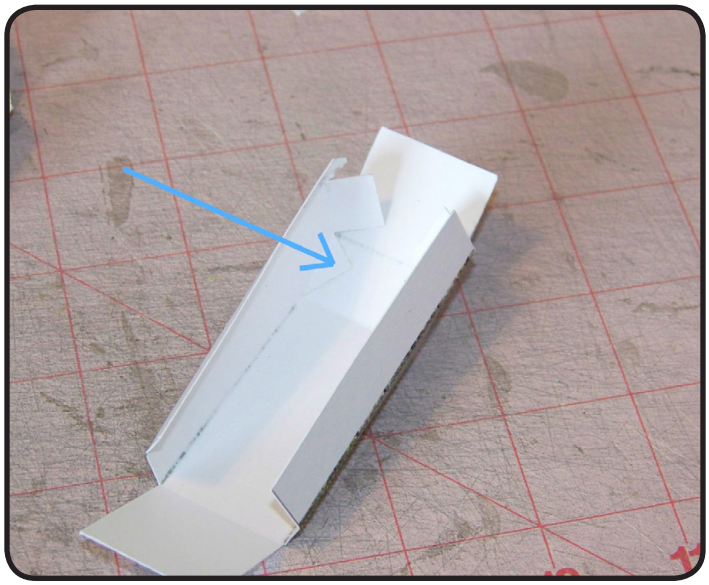
3: Once fully dry, go ahead and fold at the score lines (using a straight edge along the inside face will ensure a crisp fold edge.)

4: Glue the two halves together and allow to dry.

5: Glue into a ring and set aside to fully dry.

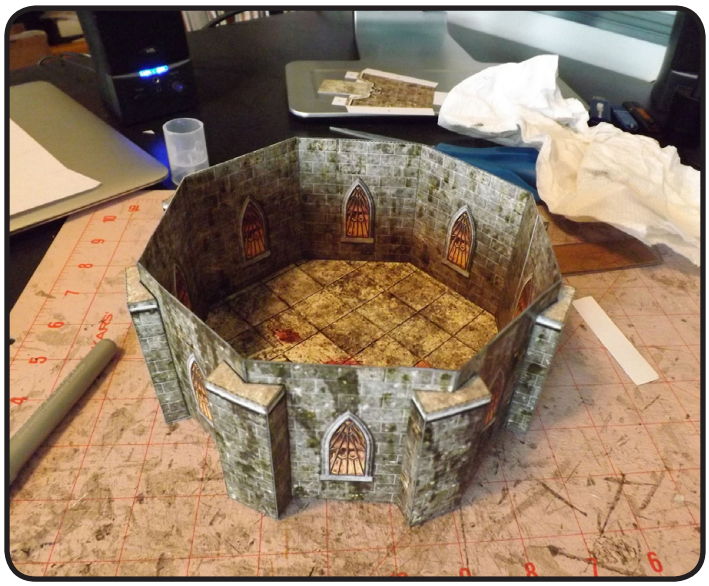


6: Insert and glue the floor into place.

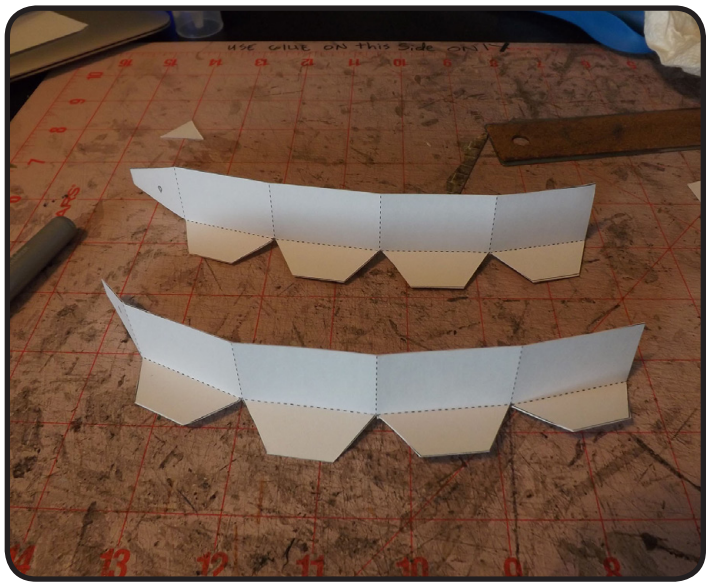


7: Cut, score and test fold the upper buttress pieces.

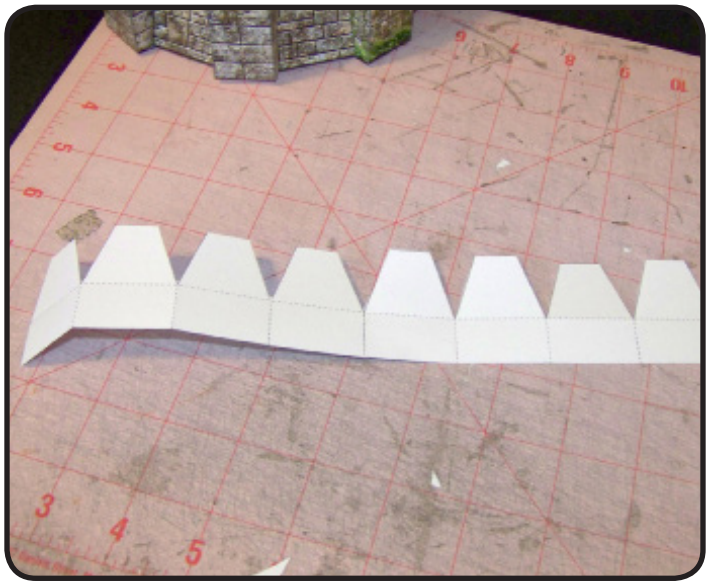
8: Glue the tabs as shown above and allow to dry before proceeding.



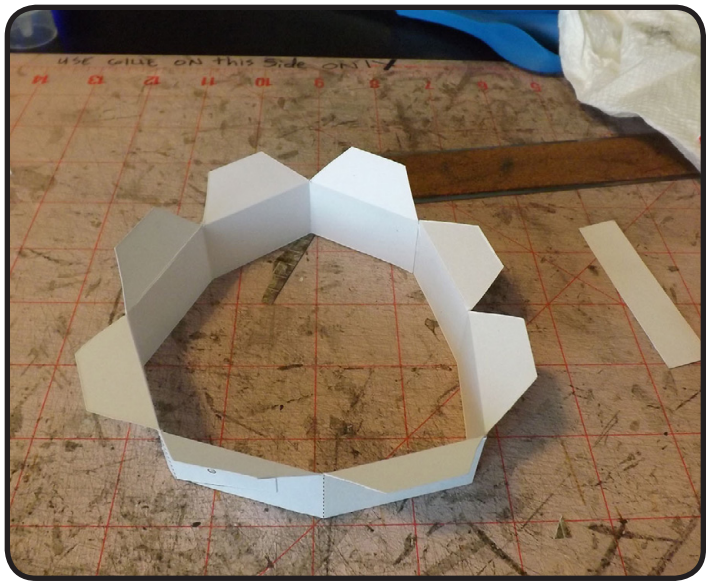
9: These simply glue around the perimeter of the second level.



10: An ‘adaptor’ is required for the second level to align and lock to the first level. Cut, score, yadda yadda yadda...



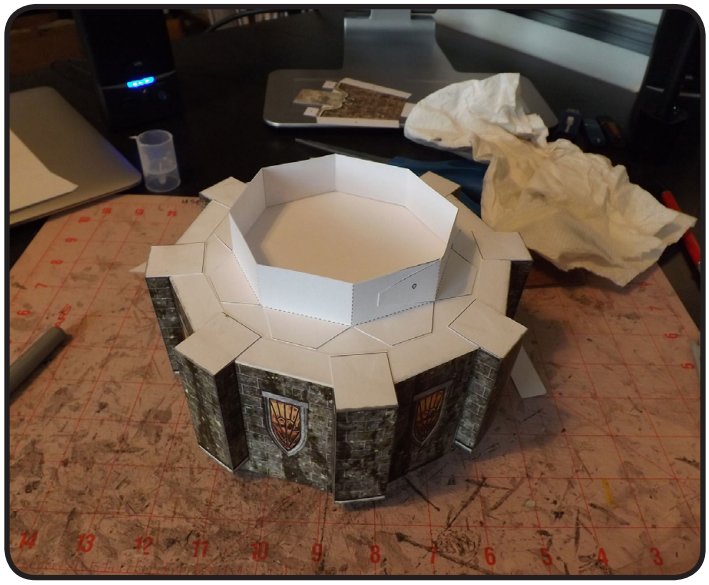
11: Glue into a single long piece.



12: Glue into a ring.

13: Insert the finished adaptor into the first level as shown, and place a SMALL drop of glue on the TOP facing side of each tab, being careful not to use so much it leaks over the edges onto level 1 when the two levels are mated together.

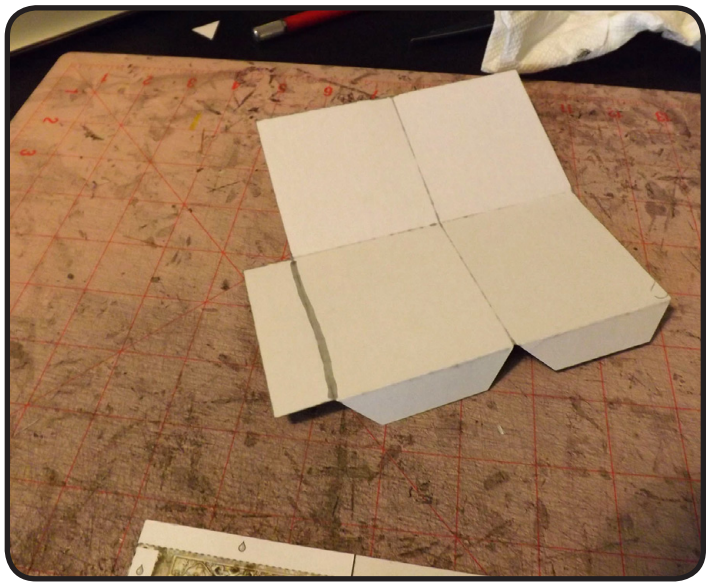
14: Carefully align the level 2 piece and gently press down.



15: The finished adaptor will now be correctly aligned on level 2.

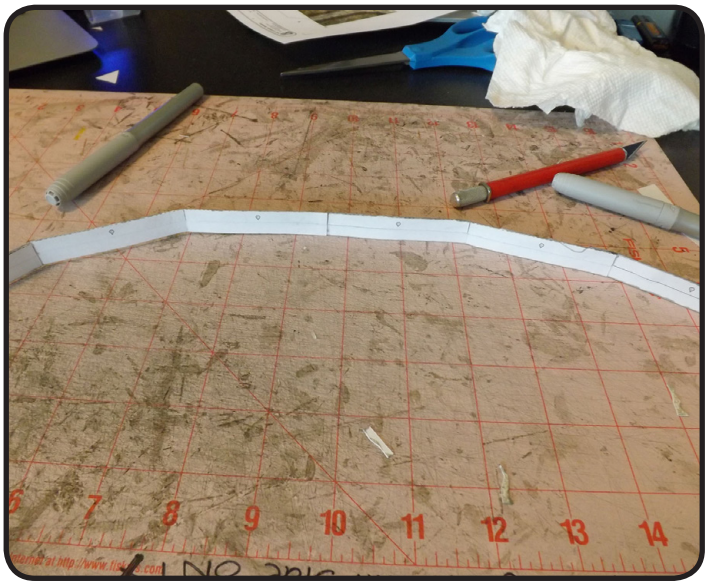
LEVEL 3

1: Level 3 & 4 have an added addition of a collar ring along their bottom edge to attach to the level below.

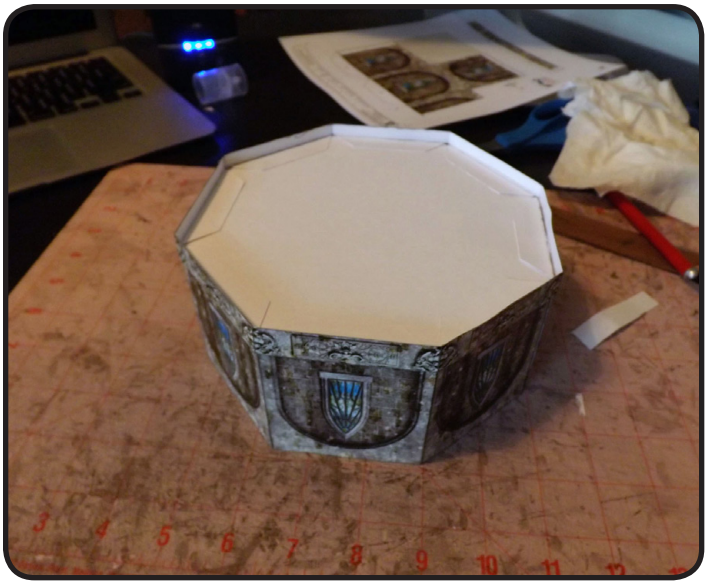


2: Glue the walls as with level 2 (note we've edged the piece prior to gluing as marker ink doesn't usually adhere to glue well.)

3: Glue into a ring and allow to dry. Then glue the floor piece into place.

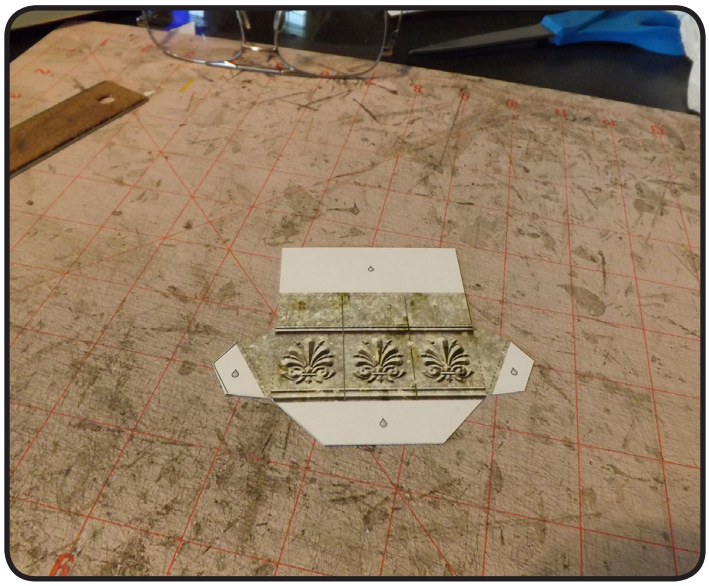


4: Fold the small tabs over and glue on each collar strip as shown. This 'double thickness' edge is what will glue to the model sides.

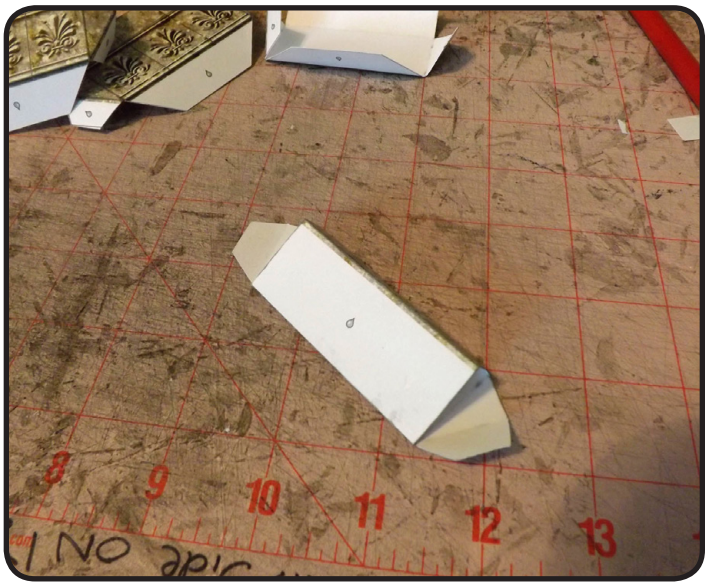


5: Glue the collar to the lower edge, one strip at a time (do not glue the collar into a ring before attaching to the main tower piece). Glue the double thick portion to the model, allowing the single layer portion to drop below the bottom of the model. This will ‘grip’ the walls of the level below.

LEVEL 4



1: Level 4 is just like level 3, except it also has the addition of the supports for the tower top level. Cut and score each of these as shown.



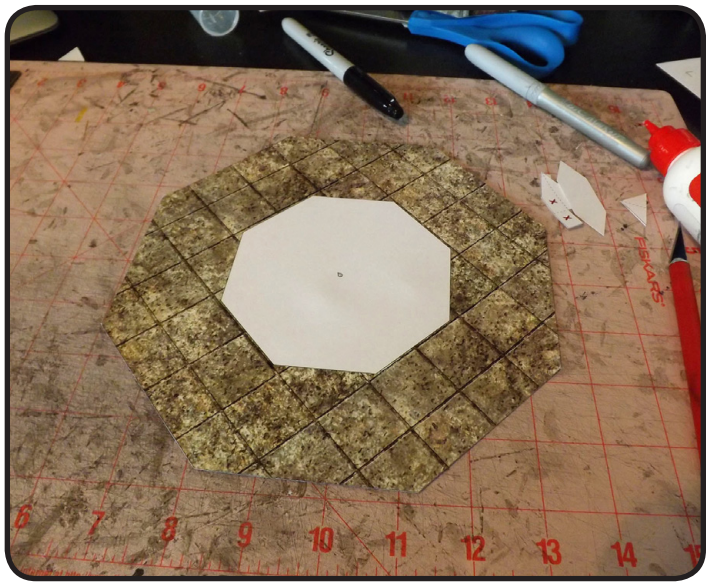
2: begin by gluing the long edge first (it's OK to squeeze the lower edge to make sure the tab glues flat, you won't damage the piece.)

3: Finish by gluing the end flaps into place.

4: Glue each support around the upper perimeter of the outer wall.

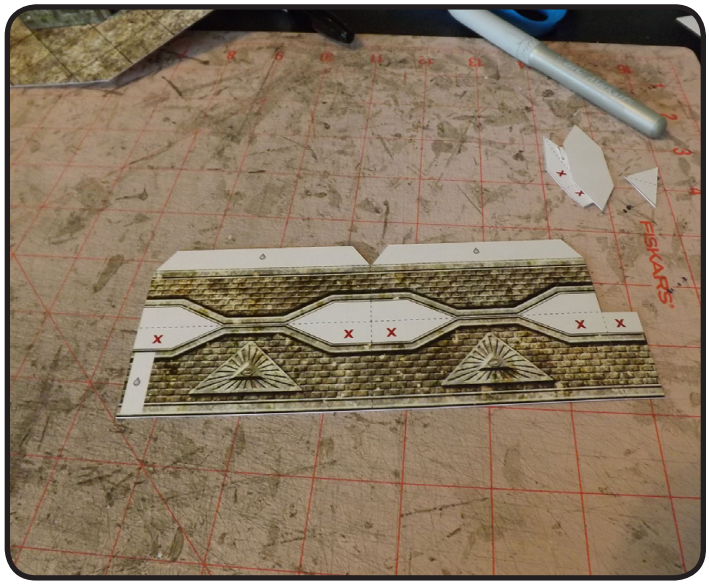
LEVEL 5

1: Construct the inner building piece just as you have the previous levels.



2: Cut out the base piece.

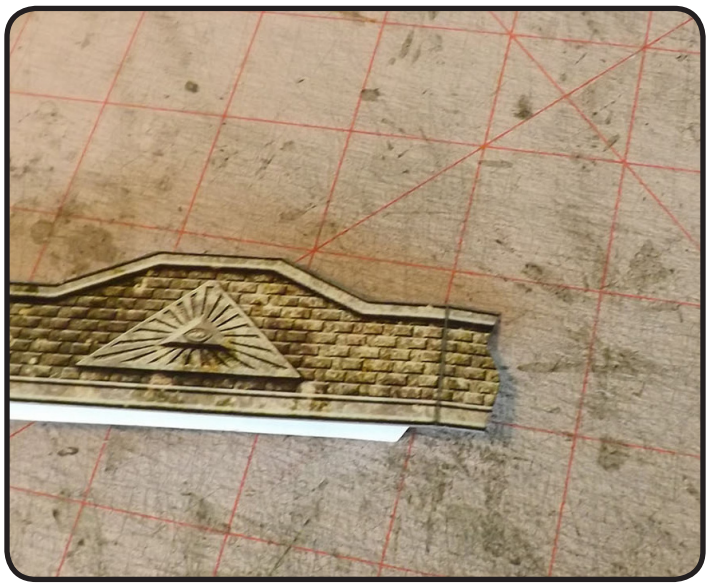
3: Glue to the base piece.



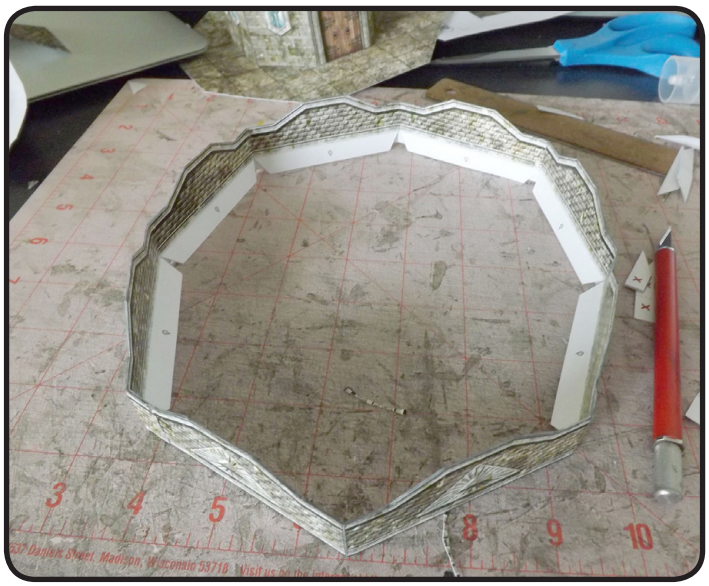
4: The outer walls construct like the inner walls, cut and score.

5: Fold and glue in half.

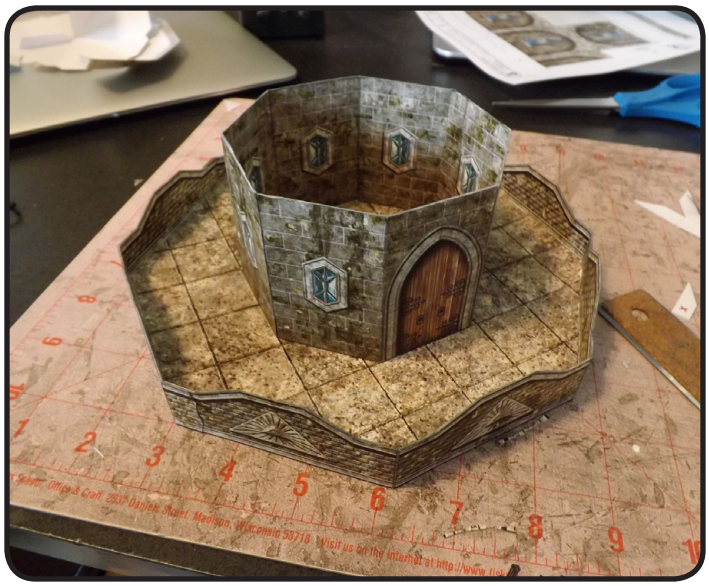
6: Cut away the excess white areas as shown.



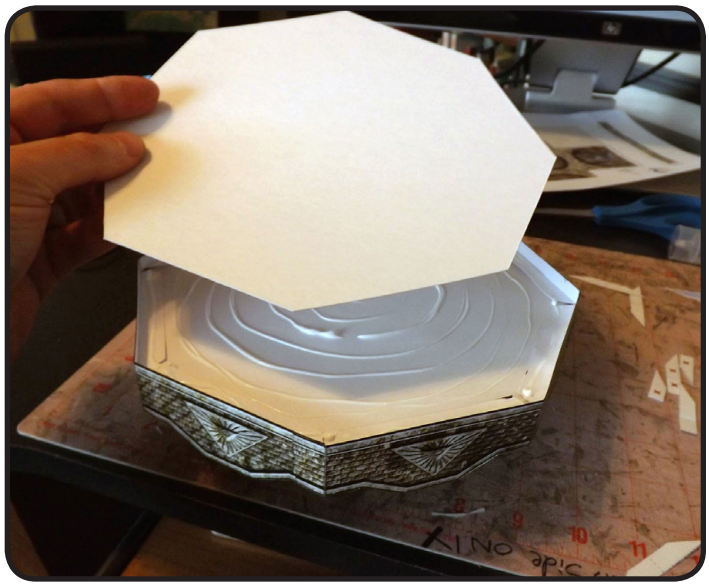
7: You can cut an irregular edge to the glue tab if desired.



8: Glue the individual sections into a ring.

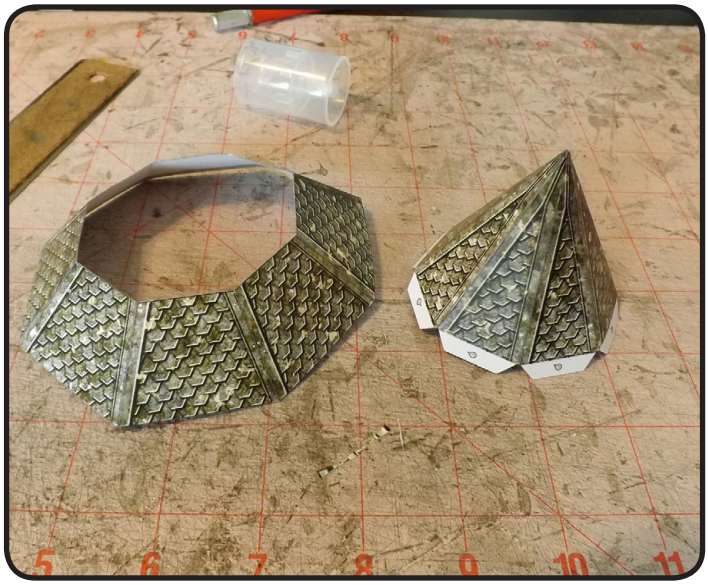


9: Glue the ring to the floor as shown.

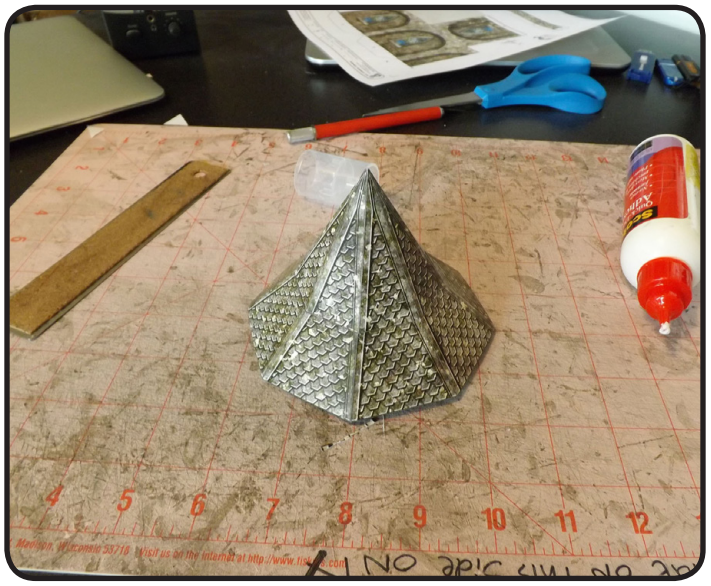


10: Glue the lower floor piece (plain white) to the underside as depicted above.

11: Cut and score the roof pieces.



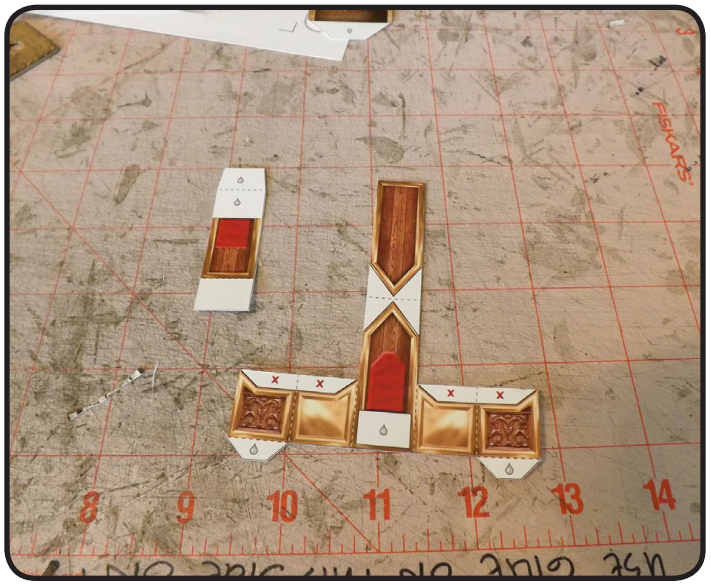
12: Glue each together as shown.



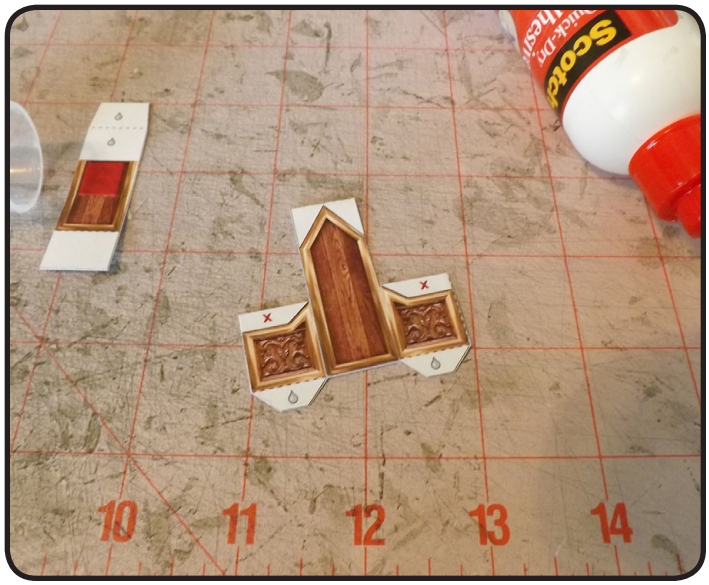
13: Glue the two pieces together and set aside to fully dry.

Just a quick FYI folks; I always try to keep an eye out for new glues to use and found this at Wal Mart in the scrapbooking aisle. It dries almost as soon as you apply it. The bond is as tight or tighter than any other glue I use and it has an applicator tip that is TINY- perfect for small edges and flaps! GET SOME TODAY!

Items



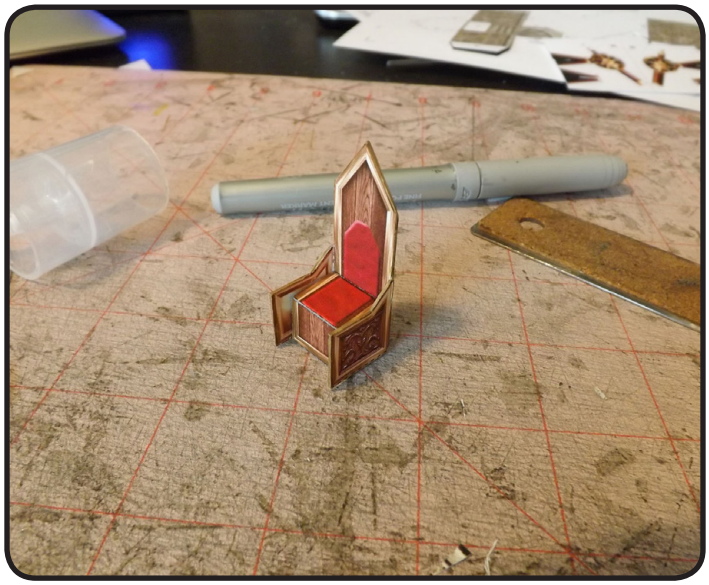
1: Cut and score the chair pieces.



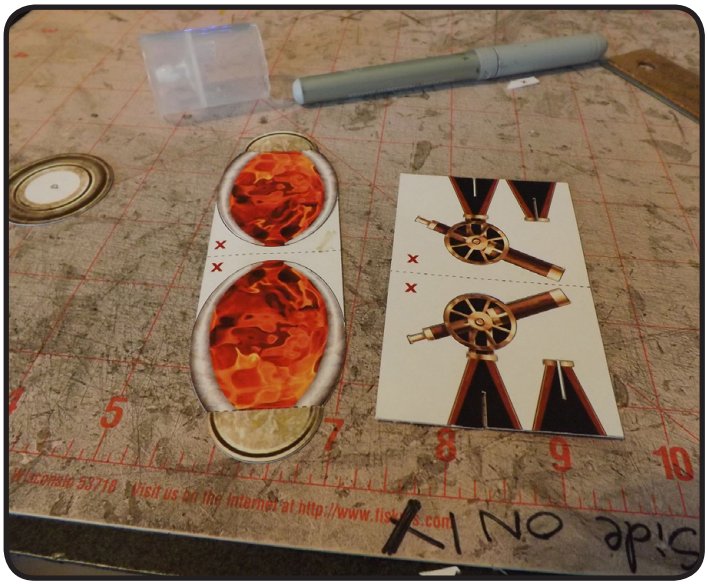
2: Fold the outer flaps inward and glue.

3: Glue the set piece into a square.

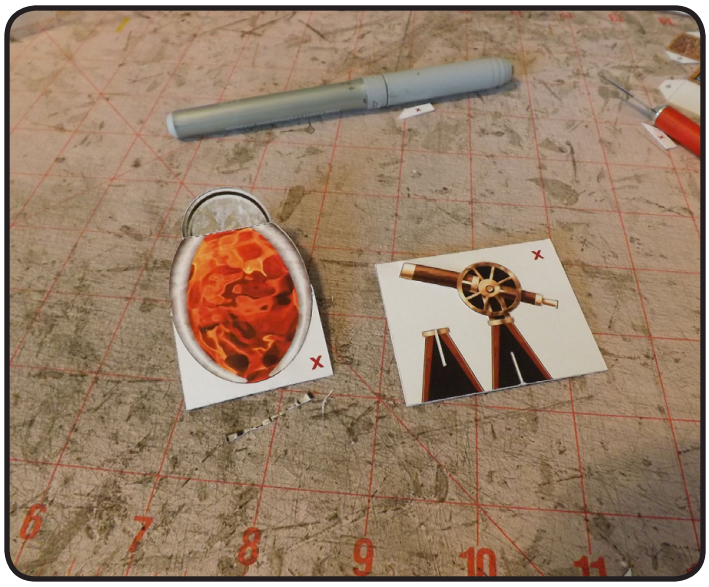
4: Glue the seat piece to the main chair as shown.



5: The finished chair after gluing the lower tabs.

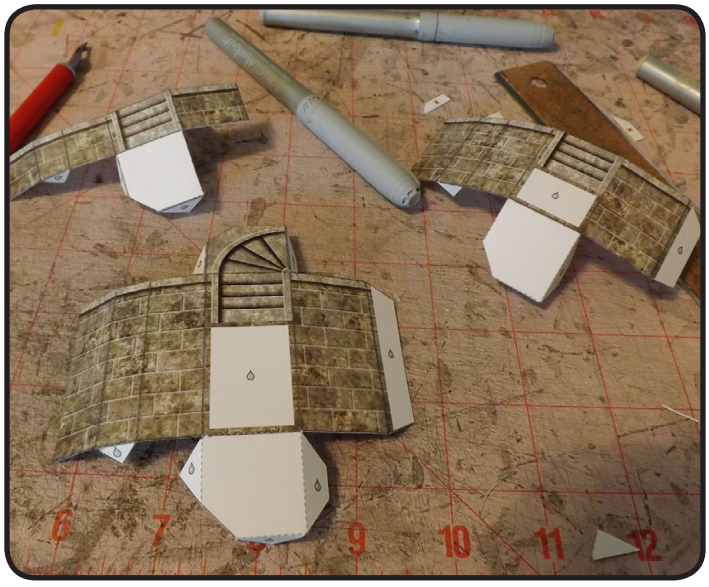


6: Cut and score the telescope and dimension door pieces.

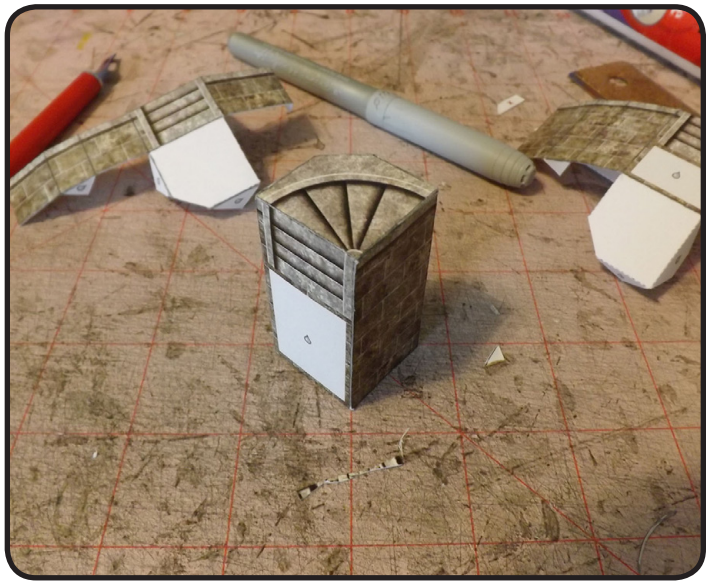


7: Fold the main sections in half and glue. Be sure not to glue the lower sections of the dimension door piece (these fold outward to attach to the base.)

8: Cut out the main door piece and the telescope parts. The telescope parts slot together as shown above, and the dimension door glues to its base.



9: Cut and score the spiral staircase pieces.



10: Glue each section as shown above.

11: Glue the three completed subsections into the larger final shape.
