MASTERBOARD

The WorldWorks Masterboard is the perfect way to define a playing area without taking up the entire gaming table. Its also the best way to keep your ground tiles from warping. Once complete you will have a sturdy gameboard that will last you as long as any gameboard in your closet ;)

STEP 1

- There are six core ground tiles for use in this pack, allowing you to create a variety of terrains. Twelve of these tiles fit perfectly on a 28 by 21 inch sheet of foamcore found at almost any drug or office supply store. First you must decide what tiles you wish to paste to your foamcore. Look through the various templates and think about how they might fit together on your unique board.
- Once you've chosen your tiles print them off and cut them out.

STEP 2

- Start by pasting the back of your selected tile with a thin but even coat of glue.
- Place your first tile at the top left corner of the foamcore making sure it is flush and even on all sides.
- Once the tile is in place, quickly smooth any air bubbles out of the tile with the palm of your hand. Work the air bubbles to the edge of the tile. Be careful not to move the tile during this process.
- Continue pasting tiles from the edge of the last tile and repeat the above steps. In no time you will have covered the entire board.

Step 3

- As a nice finishing touch you may wish to apply the included board trim. As minor as this element may seem it really does add a nice professional edge to your finished board! One sheet of board trim should cover all four sides of your board.
- The best thing about the modular nature of these tiles is that you can create countless board designs and link up your many boards.
