WINTERHAWK

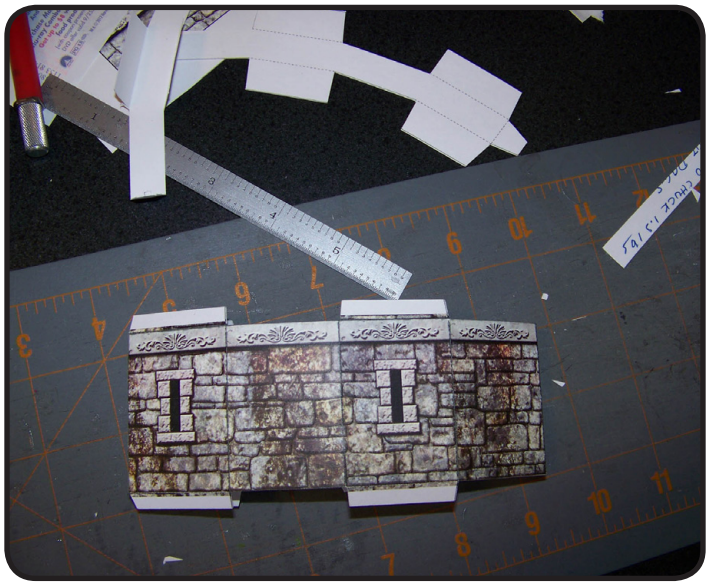
TOWER RUINS

Miniatures by REAPER MINIATURES (www.reapermini.com)

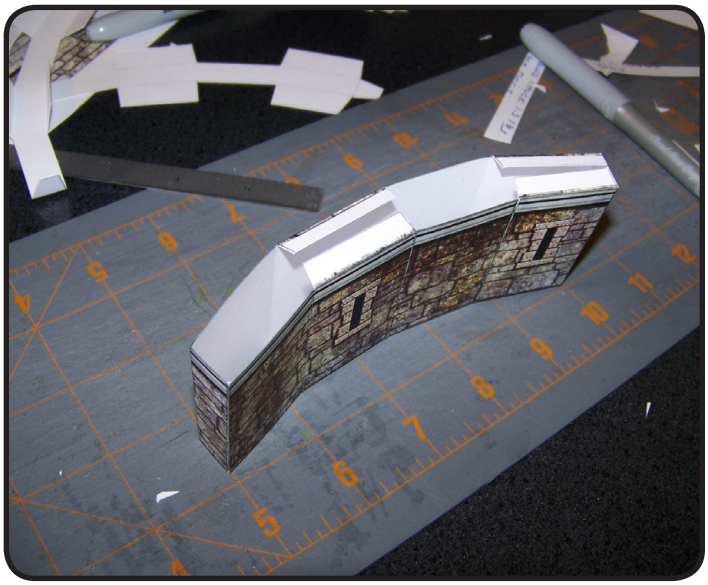
Before proceeding with this document, make sure you have read the beginners guide to card modeling included with this model set!

FAT DRAGON GAMES

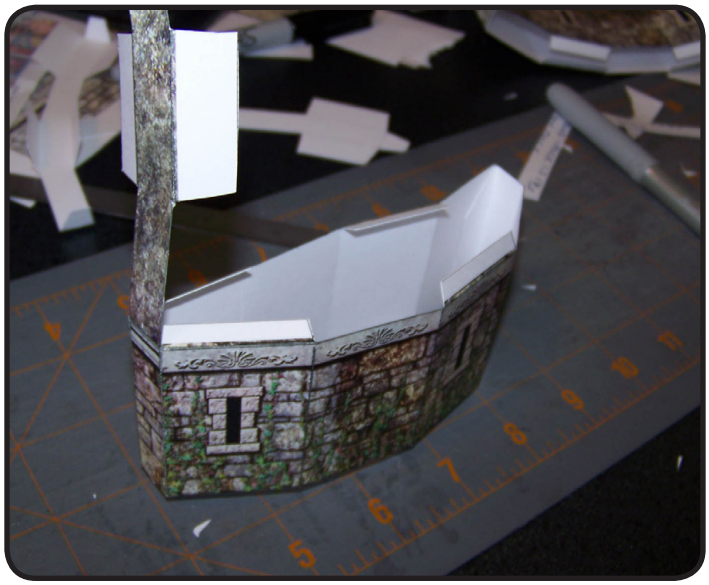
Walls



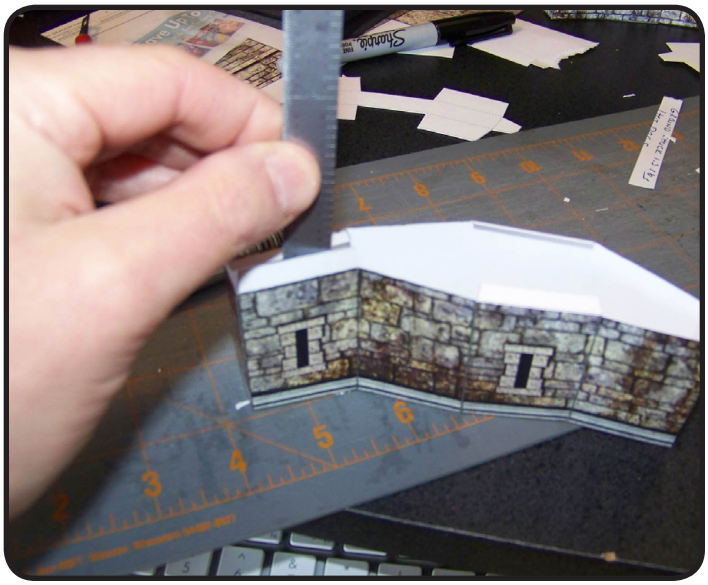
1: Cut and score the exterior and interior wall sections as shown.



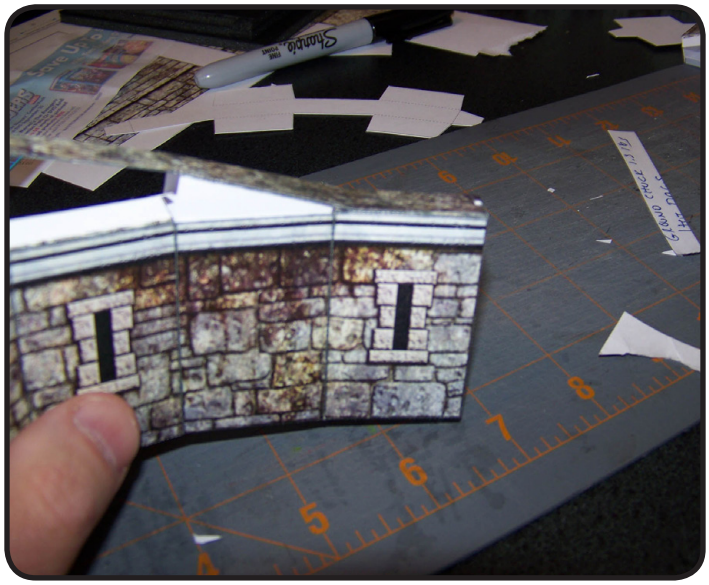
2: Glue the ends together as depicted above.



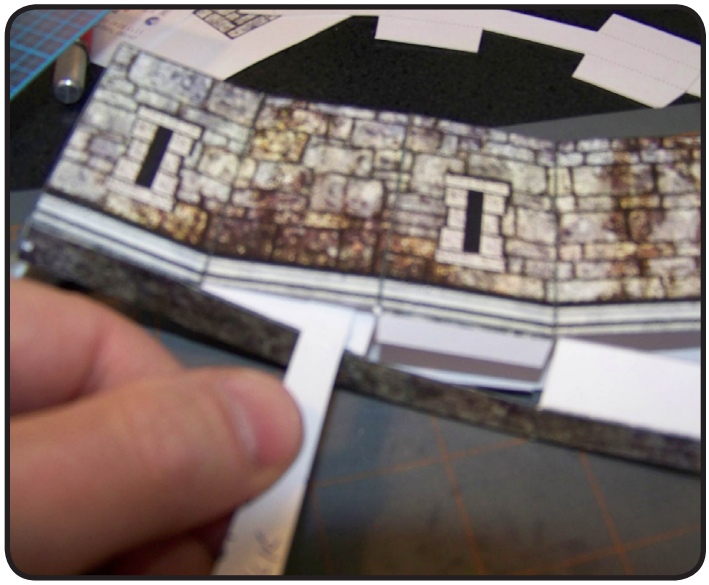
3: Glue the top section to one end of the wall assembly.



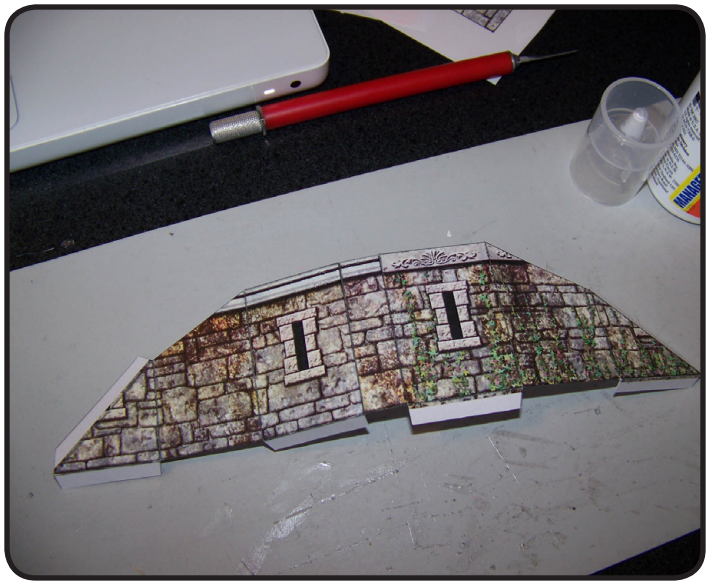
4: Flip the model upside down and use a ruler or pencil to apply pressure to the interior glue tabs as they dry.



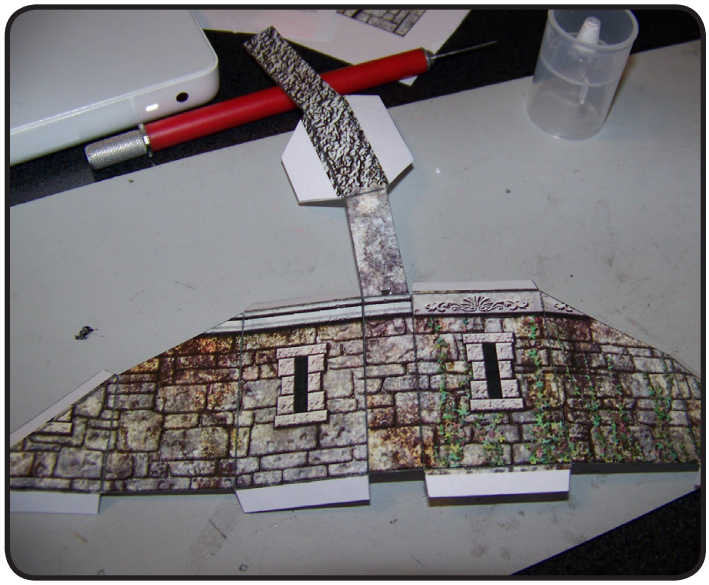
5: Work one pair of tabs at a time, allowing to fully dry before proceeding to the next pair.



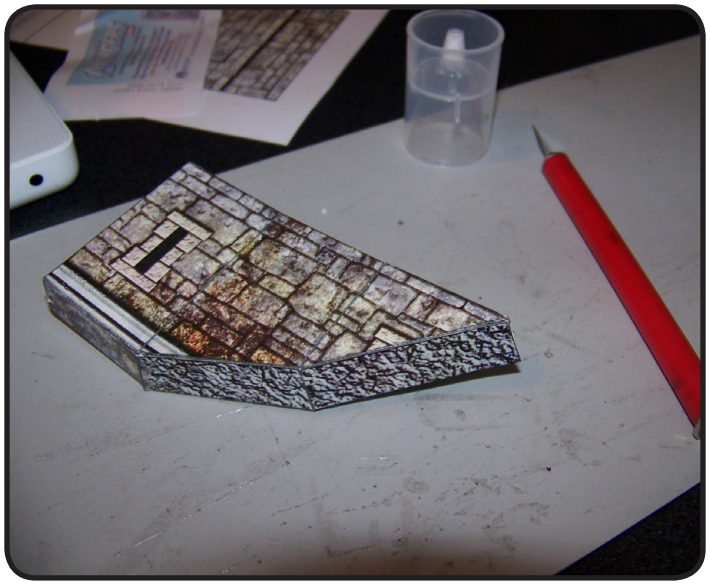
6: Glue can be applied to difficult to reach tabs with a scrap of paper.



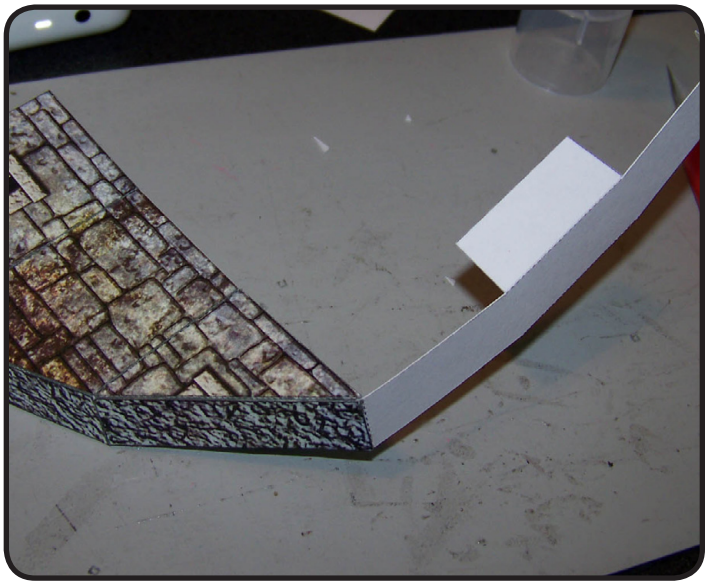
7: The ruined walls assemble much like a standard wall. Begin by gluing the two side wall sections together as shown above.



8: Glue the upper section to the side walls.

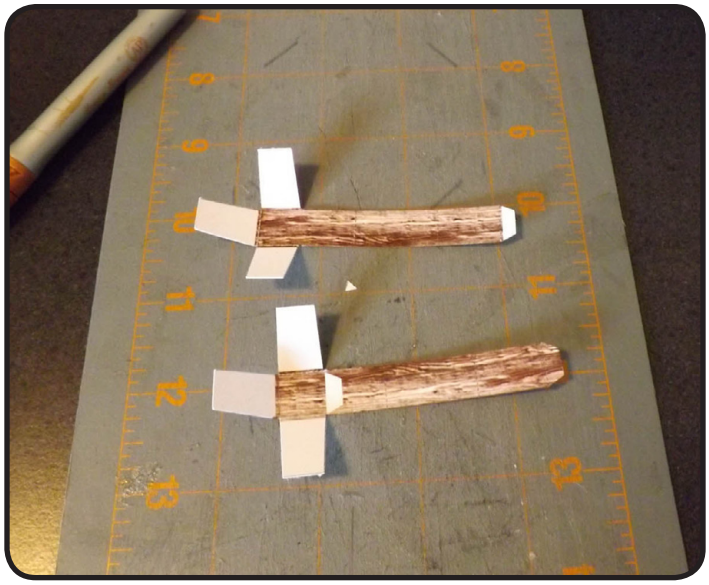


9. Glue the upper strip one section at a time.

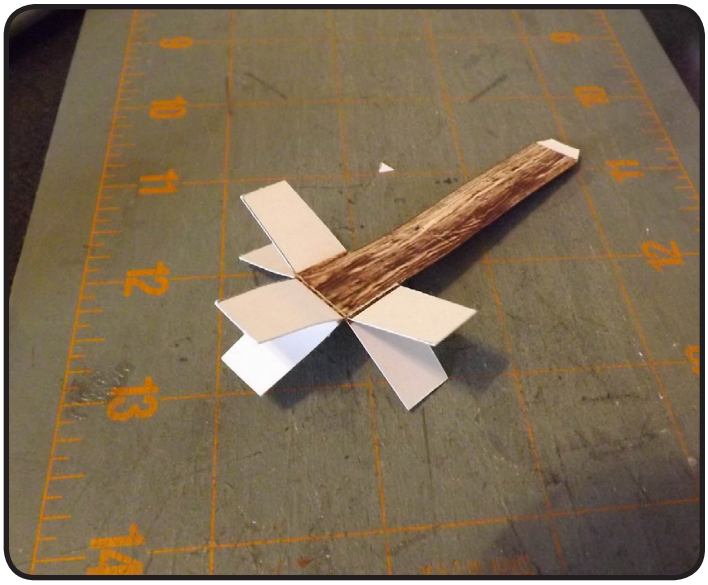


10: Finish by gluing the bottom flap shut.

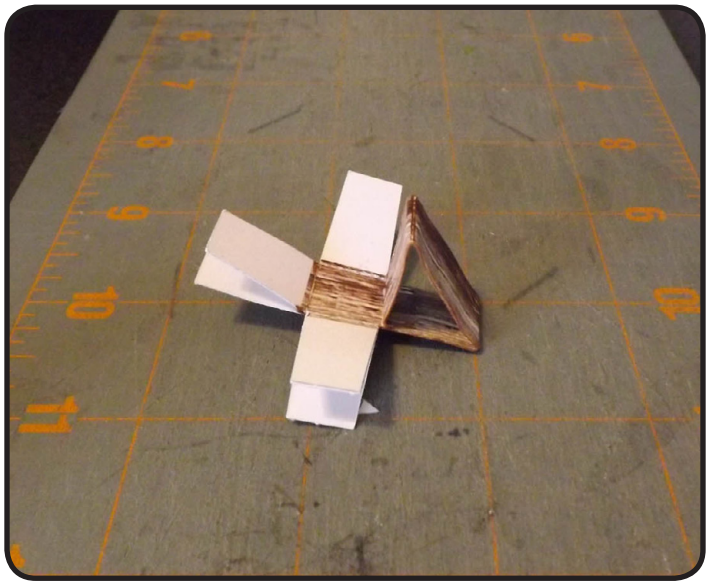
E-Z LOCK Supports



1: Cut and score as shown. You need an upper and lower section for each finished support (the lower has the small white glue area in the middle).

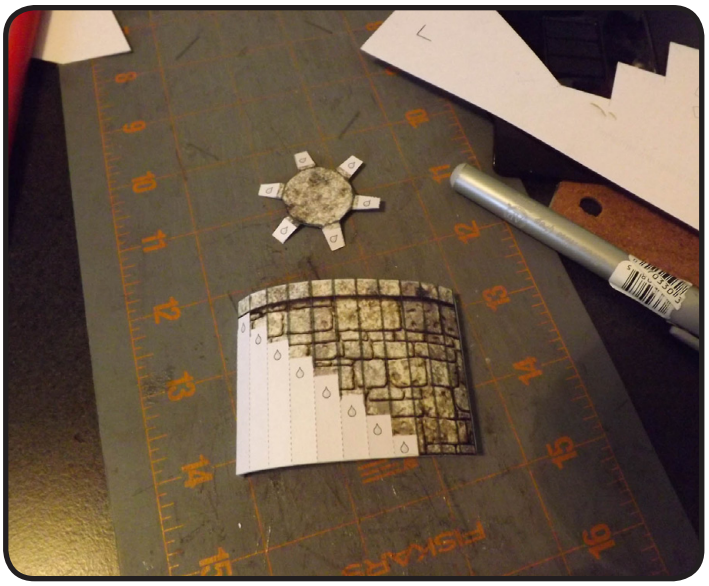


2: Glue the two halves together, making sure the outer tabs do not get glued together.

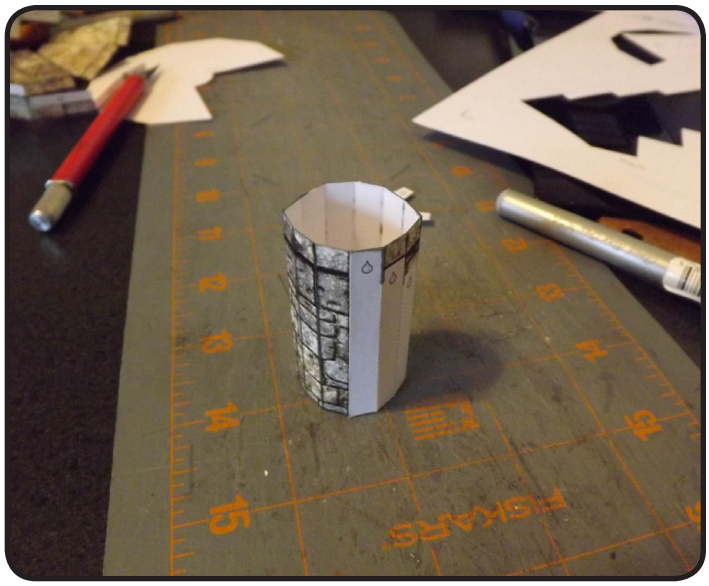


3: Fold the long end into a triangular cross section and glue as depicted above.

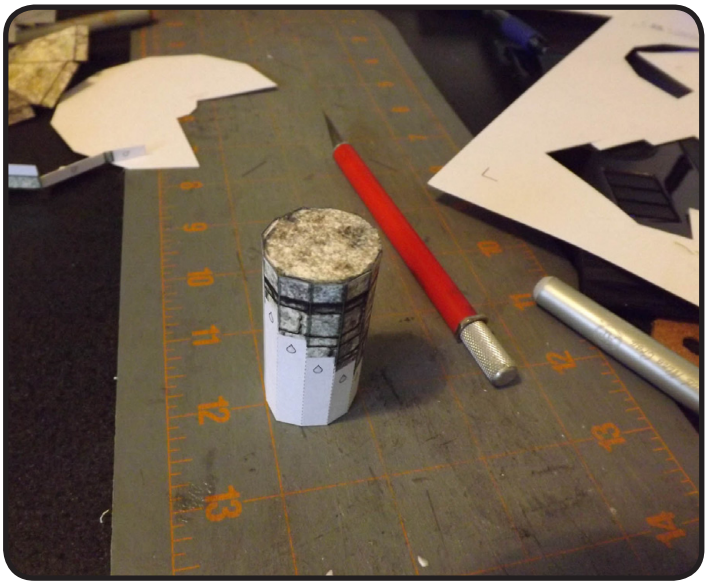
Spiral Stairs



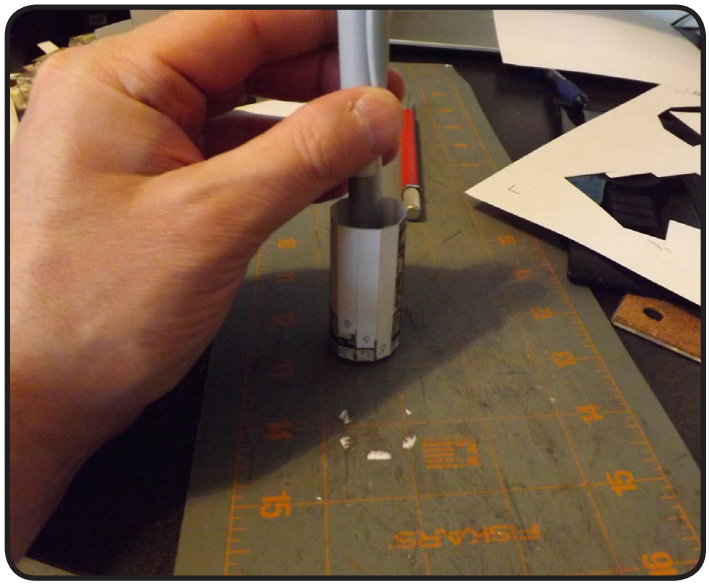
1: Cut and score the center pillar pieces.



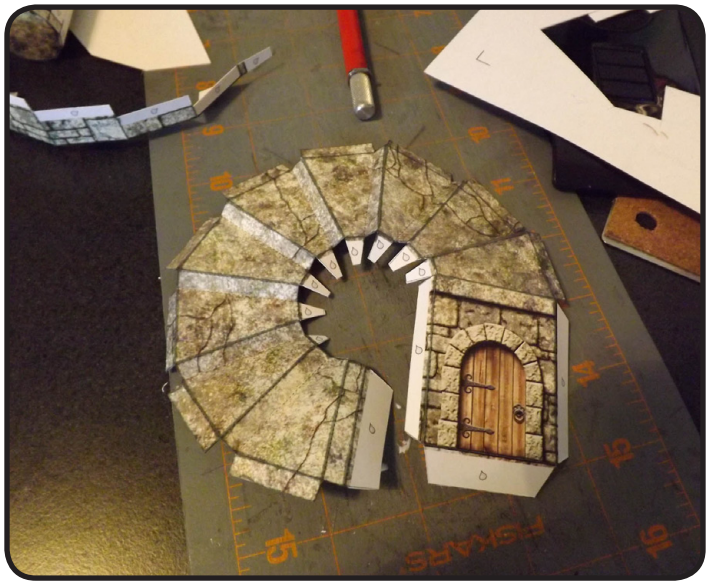
2: Glue the main piece into a tube shape and allow to dry.



3: Glue the top cap into position.

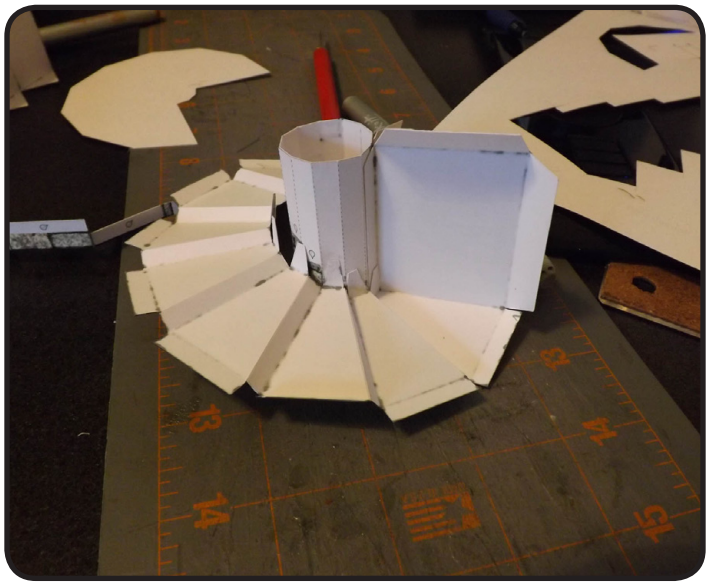


4: This is easiest to accomplish if you push it through the bottom of the tube and use a pencil to push it into place and apply pressure to the tabs (apply glue to the interior of the walls before inserting the top cap through the bottom.

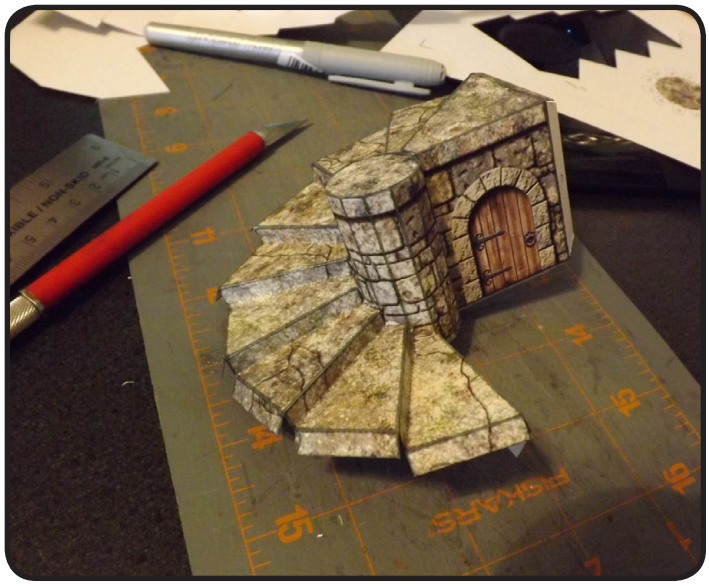


5: Cut and score the main stairs piece.

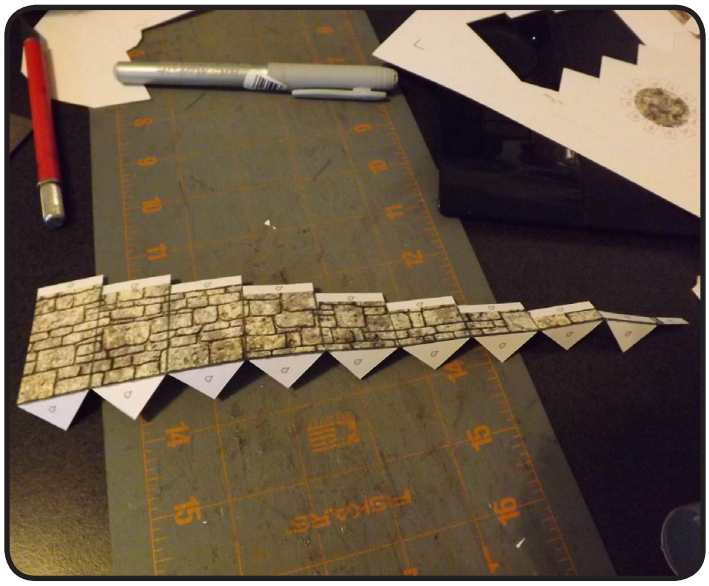
6: Glue the end (the section with the door) to the center pillar and allow to fully dry.



7: Begin gluing the stair attachment tabs to the center pillar one tab at a time.



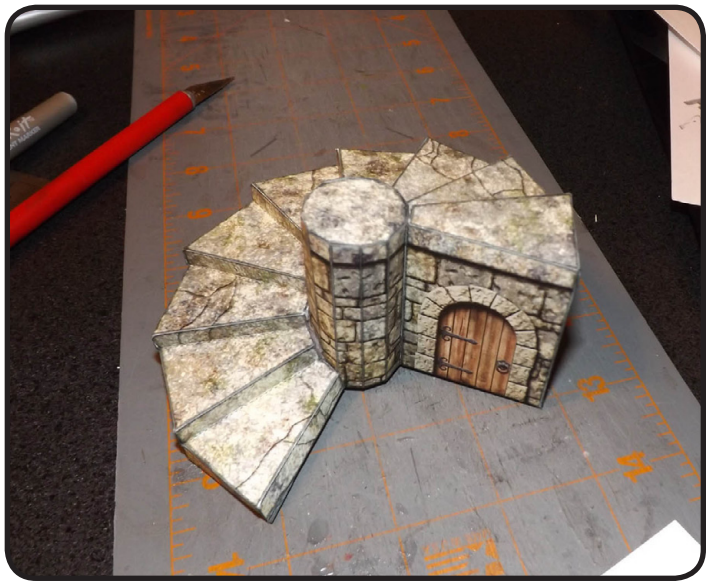
8: Continue gluing around the entire circumference of the pillar until all stair tabs have been glued.



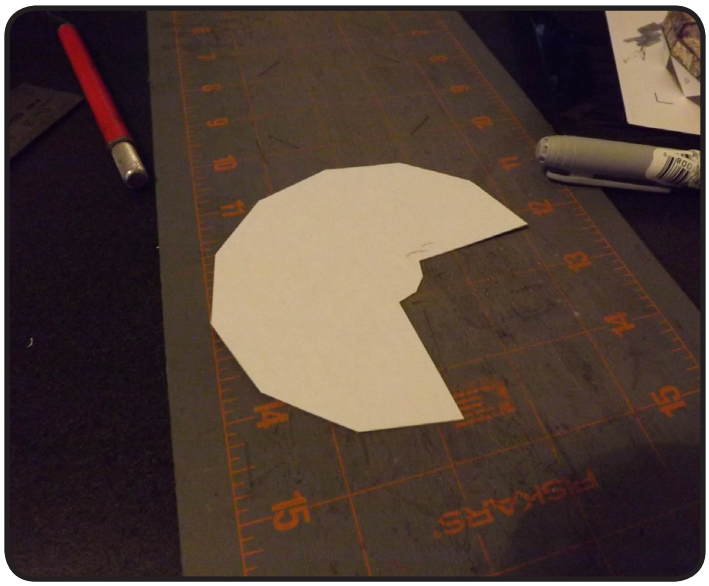
9: Cut out and score the outer side wall for the stairs.

10: Glue this to the side of the door face as shown above.

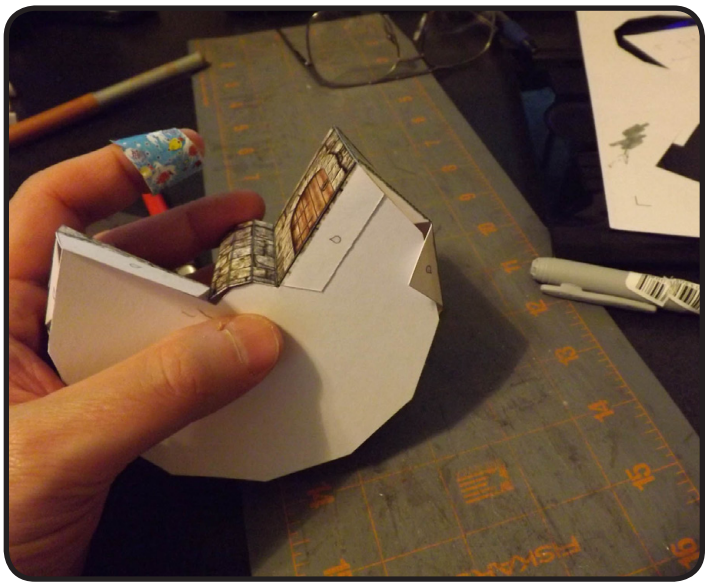
11: Begin gluing to each stair side tab one section at a time.



12: Continue until you reach the bottom stair section.



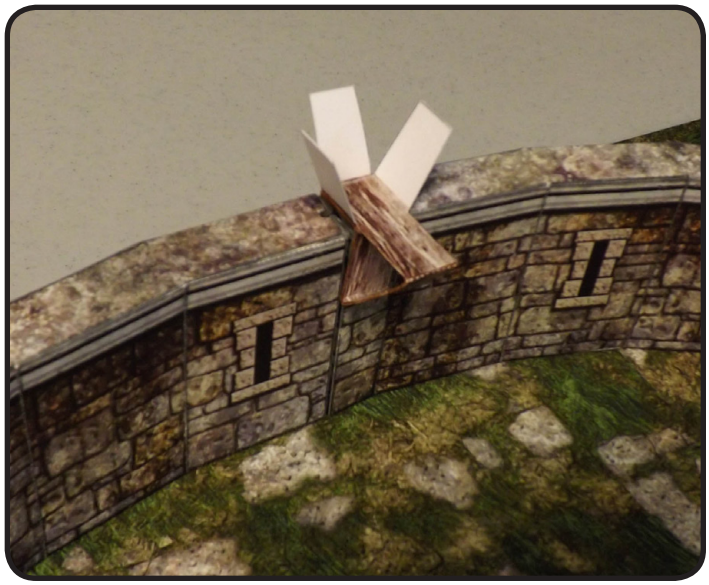
13: Cut out the bottom piece.



14: Begin gluing to the bottom of the stairs. For the outer triangular tabs, glue one to the inside of the bottom piece, then one to the outside, alternating around the perimeter as shown above.

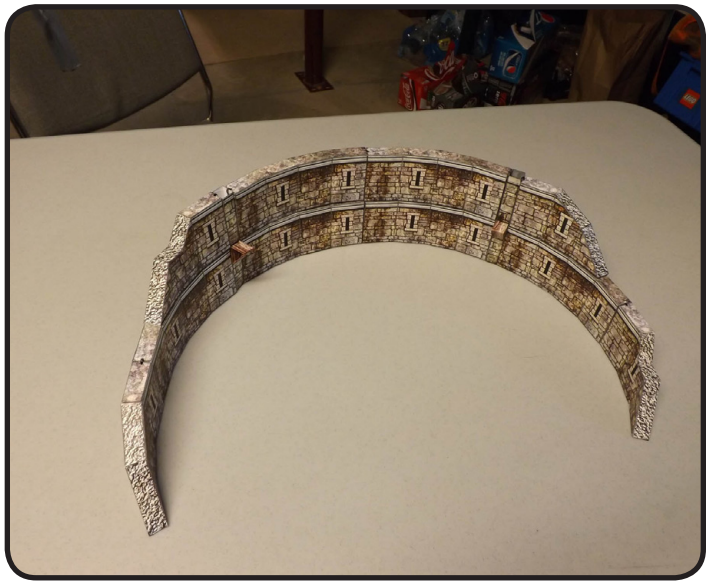
Putting it all together

1: Use an E-Z LOCK connector between ever two wall sections (if you were making a full circle, you would have a post, then two wall sections, another post, two wall sections, etc. for a total for four posts and eight wall sections.)

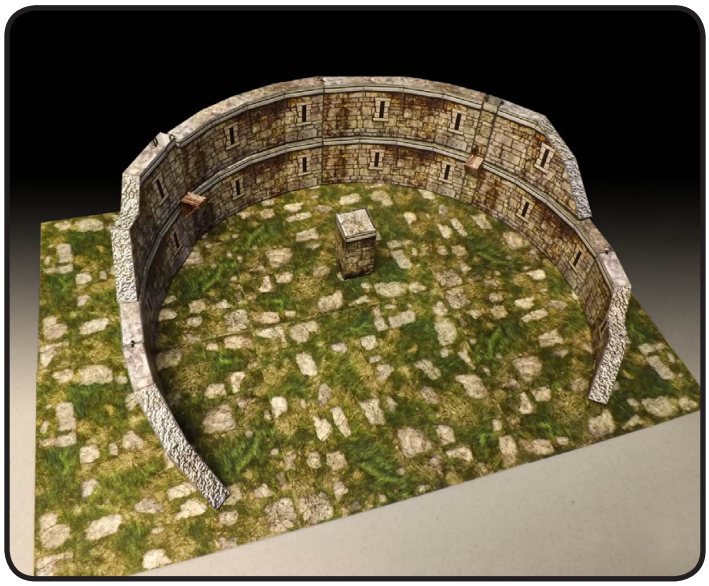


2: Insert an E-Z LOCK support.

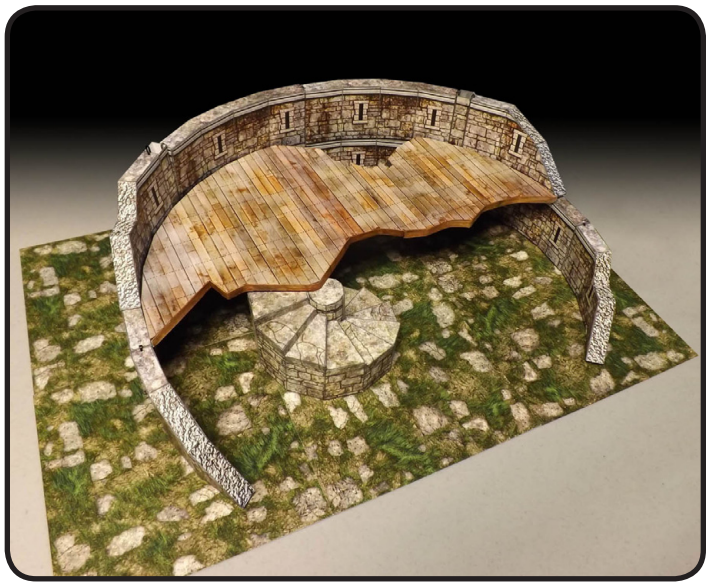
3: Add another connector if you intend on adding another level.



4: Here is the finished wall we use as an example build. You can design your ruins however you like.



5: To help support the floor section we've added a center pillar.



6: You can make the floor piece in any shape you like. Here we've made ours out of two floor 'quarters' with a jagged edge cut around it. Use the side strips to cover the foamcore edge on the inside edges (the ones that are not adjacent to the walls.)
